

WAZO User Manual

Your personalized wealth organizer

Version 1.1.4 | Build 1.1.4.0 | Updated 2026-07-20

Recommended First-Time Workflow

Start with clean profile data, then build member-owned assets and reports.

Local-first and private

WAZO stores user data locally as JSON files. The app is designed for privacy, offline use, and user-controlled backups.

Purpose

WAZO is a local-first personal wealth organizer for Windows. It helps users organize family profiles, members, assets, financial goals, reports, backups, and optional Zakat workflows.

WAZO stores user data locally as JSON files. The app is designed for privacy, offline use, and user-controlled backups.

Navigation Overview

Use the left navigation panel to move between major work areas:

- Portfolio
- Assets
- Asset Library
- Asset Performance & Reports
- Zakat Center (when enabled)
- Financial Goals
- Calculators
- Settings
- Activity & Events
- Help
- About

When the optional Zakat module is enabled, the Zakat Center and Zakat settings become available.

Navigation Overview

Use the left navigation panel to move between major work areas:

When the optional Zakat module is enabled, the Zakat Center and Zakat settings become available.

Feature Areas

Portfolio

The Portfolio page gives a high-level view of the selected profile and financial year. Users can review net worth, asset records, net worth growth with axis values, current allocation, desired allocation from allocation targets, required rebalancing, member breakdown, and smart analytics. The Set Active FY button is shown only when the selected financial year is not already active.

The financial year runs from April 1 to March 31.

Member Setup

Member Setup is available under Settings. It controls families/profiles and members. Assets should be owned by members. Profile totals are calculated from member-owned data.

Assets

The Assets page manages confirmed holdings together with recurring investment plans, pending investment reviews, and confirmed transactions. Users can add, edit, delete, search, sort, print, and export assets. Each asset must have an existing member owner. Planned SIP occurrences do not change holdings until the user reviews and confirms a transaction.

Asset Library

Asset Library contains reusable definitions, definition prices and rate sources, allocation targets, the asset class registry, the definition library, and legacy type mappings. Editing library definitions does not silently rewrite historical snapshots.

Allocation Targets

Allocation Targets define the desired wealth mix. They can apply to family/profile scope or member scope. Duplicate owner/category targets are blocked, totals must not exceed 100%, and the table shows current value, desired value, and the required buy/reduce amount.

Optional Zakat Module

Zakat is optional. When disabled, Zakat-specific pages, fields, reports, cards, reminders, and calculations should be hidden or inactive. When enabled, users can set default Zakat rate, upcoming Zakat date, payees, categories, payments, and distribution.

Financial Goals

Financial Goals helps users plan future financial targets, FIRE number, monthly needs, annual need, goal progress, and individual goal trackers. Goal Intelligence highlights deadline pressure and estimates monthly and annual investment amounts across equity, gold, and real estate assumptions to help users compare a practical funding mix.

Calculators

The Calculators page includes SIP, SWP, lumpsum, FD, EMI, goal SIP, inflation impact, CAGR, delayed SIP cost, RD, and projection calculators.

Asset Performance & Reports

Asset Performance & Reports helps users investigate asset and category value, gain/loss, CAGR, residual-checked XIRR, allocation, and historical growth. Desktop reports can be printed or exported as PDF, Excel-compatible XLS, CSV, JSON, or HTML. Zakat-specific cards and post-zakat analytics appear only when the optional Zakat module is enabled. Android clearly reports PDF and Print as unavailable instead of creating fake output; use Excel, CSV, JSON, or HTML export there.

Settings

Settings controls general setup, member setup, storage, backups, portfolio view, asset settings, Zakat settings when enabled, payee categories when enabled, themes, header shortcuts, export options, notifications, and navigation visibility. Regional Format changes date, number, and currency grouping conventions across the app; it does not translate buttons or page text.

Backup And Restore

Backups include portfolio data, app settings, activity logs, and event logs. Manual backup creates a timestamp-matched four-file set. Automatic backup can run Daily, Weekly, Monthly, or at a Custom day interval while WAZO is open; a missed due schedule runs the next time WAZO opens.

Import first validates either a combined WAZO export or a complete timestamp-matched four-file backup without changing local data. WAZO shows the family/member/asset/log summary and requires explicit confirmation. Restore creates a pre-restore backup and replaces all four local files atomically. If startup detects an interrupted write or damaged JSON, WAZO rolls back or restores the last validated generation; damaged files are preserved for inspection. Android reset requires a structurally complete four-file native store, completes a backup first, and restores the previous files if a replacement write fails.

Privacy Mode

Privacy mode structurally redacts sensitive financial figures across cards, tables, charts, reports, allocation views, financial goals, Zakat views, smart-insight explanations, activity details, diagnostic details, copied content, and generated exports. Privacy-mode exports use a generic filename and do not embed sensitive raw report rows.

Activity And Events

Activity & Events keeps normal user actions and technical diagnostics on one page with separate filters. Privacy mode masks sensitive detail text in both tables.

Help And Support

The Help page explains app workflows, opens support templates, and includes an Open PDF Manual action. Keyboard users retain native select behavior, visible focus, accessible pagination, and a focus-contained first-run setup dialog.

App Updates

App Updates is available under About. Trusted JSON-only data/settings patches are previewed, explicitly confirmed, fully validated, and applied atomically. Unsigned application-bundle patches are blocked; install a signed WAZO release for application-code updates.

Troubleshooting

If totals look wrong, confirm the active profile, selected financial year, member ownership, and deleted asset state.

If Zakat items are visible when not needed, open Settings, disable the Zakat module, and save settings.

If backup fails, choose a valid backup folder and try again.

If local JSON is incomplete or damaged, use the startup recovery prompt to select a complete WAZO backup. WAZO preserves the damaged files and never silently replaces them with demo data.

If layout looks broken, resize the window, check the selected theme/control size, and report the issue from Help.
